Outdoor Microphone
Nor1217 for semi-permanent installations

- Outdoor microphone for community and aircraft noise.
- Fulfils IEC 60651, IEC 61672 class 1 and ANSI S1.4 type 1 (when used with Sound Analyser Nor140).
- Protection class IP 55 (dust and water).
- Easy to calibrate with a normal ½” sound calibrator.
- Microphone verification by SysCheck facility.
- Delivered with individual calibration certificate.
- Directly powered and supported by Sound Analyser Nor140 and Nor150 (built in selectable frequency correction networks and SysCheck signal generator).
- Approved by PTB, Germany.
- Low cost. Use microphone and preamplifier supplied with Nor140 and Nor150.
The Outdoor Microphone Nor1217 is a high quality measurement microphone for all-weather conditions, designed for semi-permanent applications requiring low power. The Nor1217 uses the standard preamplifier and microphone from the Nor140, making it a very cost effective solution.

The Nor1217 is designed for use with the Nor140 and Nor150 Sound Analyser. The instrument allows a direct connection via Nor1408A, a standard Lemo 7 pin microphone cable supplied in various lengths. There is no need for extra adapter box or power supplies. The Nor140 and Nor150 has selectable frequency correction for both community and airport applications. The instrument also supports the Sys-Check verification.

Wind induced noise

Compared to a standard measurement microphone, the Outdoor Microphone Nor1217 improves the measurement accuracy by reducing the wind noise and by improving the directional response for sound from different directions. The diagram shows the typical noise floor for different wind speeds. The noise is typically more than 20 dB less than an unprotected microphone.

A 200mm wind shield Nor4576 may be added to further reduce the wind induced noise, as required by some applications and standards. Frequency correction for the combination of the original wind-shield with the 200mm added is supported by the Nor140/150.

The correction for this combination of windshields is supported for horizontal direction only.

The Nor1217 supports two different microphone capsules. The Nor1225 and Nor1227. The Nor1225 is an external polarised free field microphone having a nominal sensitivity of 50mV/Pa. This capsule is normally supplied with the Nor140 and Nor150 sound analysers.

The Nor1227 is the pre-polarised version of the Nor1225. External polarised microphones is sensitive to drop in the polarisation voltage. Such drop may occur in high humidity environment after some years of use when the equipment may be contaminated. Contamination in combination with high humidity may cause leakage of the 200V polarisation voltage needed for the Nor1225. Hence, pre-polarised microphones is normally a better choice in high humidity environment since they are self-polarised and is not dependent on external polarisation voltage.
**Frequency response**

The Nor1217 satisfies IEC 61672 Class 1 requirements and related national standards when used with Nor140 or Nor150. These instruments applies a frequency correction to the measured noise signal when the Nor1217 and the vertical or horizontal noise incidence criteria is selected in the instruments transducer selection menu.

**Calibration**

The Outdoor Microphone may be calibrated with a normal sound calibrator suitable for ½” working standard microphones (WS2) without the need for extra accessories. Access to the microphone cartridge is easily gained by dismounting the upper part of the microphone.

The base is made of an electrical insulating material. The microphone body will be fully insulated from the mounting mast thereby reducing pickup of electrical hum and noise.

*By removing the upper part, the outdoor microphone may be calibrated as an ordinary ½” microphone.*

---

**Directional response**

The figure below to the right shows the directional response for three frequencies in a vertical plane. A similar diagram in the horizontal plane is very close to circular.

The figure below to the left shows the maximum deviations from an ideal circular response within ±30 degree from a horizontal reference axis as a function of frequency (blue curves) and the tolerance limits as specified in IEC 61672, class 1 (red).
Specifications

Acoustic performance: IEC 60651, IEC 61672 class 1 and ANSI S1.4 type 1 (frequency correction applied) with a suitable instrument (Nor140).

Max sound pressure level: >140 dB peak dependent on supply voltage.

Microphone cartridge: Nor1227 or Nor1225 (1/2" 50 mV/Pa)

Polarization voltage: 0 volt (Nor1227) 200V (Nor1225)

Inherent noise: < 17 dB A-weighted

Reference direction: Vertical or horizontal dependent on the applied frequency correction

Ingress Protection Category: IP55 according to IEC 60529.

Supply voltage: ±14 volt to ±60 volt

Current consumption: 1.5mA

Connector: 7 pin Lemo type 1B male

Temperature range: -40°C to +85°C

Height: 395 mm / 15.5" (without tripod adapter)

Diameter: Approx 80 mm / 3.1" (with windshield)

Weight: Approx 300 g (with preamp microphone)

Mounting thread: 3/8" UNC

Accessories and spare parts

Windshield upper part: Nor4529

Assembled upper part with windscreen: Nor4560

Microphone: Nor1227 or Nor1225

Microphone preamplifier: Nor1209

Sound calibrator: Nor1251 or Nor1253

Microphone cable: Nor1408A Standard lengths 5, 10, 15, 20, 30 and 50 meters – other lengths on request.

Extra wind protection: 200 mm windshield Nor4576.

Ordering information

Nor1217 – Outdoor microphone excluding preamplifier and microphone.

SysCheck verification

For verification of proper operation, the microphone is equipped with a system check facility (SysCheck), where an electrical signal applied on one of the terminals are returned after passing through the complete signal chain, thus verifying proper operation of the microphone cartridge, preamplifier and microphone cable. It is a robust and simple method for verifying a microphone system.

Typical self noise of the microphone system when the microphone is substituted by a capacitor with similar capacitance as the microphone. Note that the acoustical self-noise for a real microphone will be higher due to thermal noise in the microphone cartridge.
